

- ▶ “Tear” off a tab by clicking and dragging it to the taskbar.
- ▶ Drag the favorites icon (favicon) from the address bar in Internet Explorer to the taskbar.
- ▶ Drag an image in the web site to the taskbar.

After a site is pinned, the site renders with custom enhancements – for instance, the Back and Forward buttons match the color scheme of the web site. Sites can also be pinned to the Start menu.

The following graphic shows the taskbar elements in Windows 7.

Create a basic pinned site

Web developers can use the msSiteMode APIs to integrate pinned sites with the Windows 7 Taskbar. These APIs are divided into two groups:

FEATURE	DESCRIPTION
Taskbar button	When you click a Pinned Site button on the taskbar, the website launches in a new browser window that has been customized specifically for the site. The site icon is visible on the taskbar button.
Overlay icons	A 16x16 pixel notification icon that appears on top of the normal site icon. This notification indicates that something has changed in the website, such as new mail arriving, receiving a chat request, or being outbid in an auction. The notification is visible only when the site is running.
Jump List	The Jump List can contain static and dynamic tasks that act as shortcuts into the Pinned Site. A user can further customize their experience by pinning these items to the Jump List.
Jump List category	A Pinned Site can create and fill a single custom Jump List category by using script in the webpage. This list is dynamic.
Jump List tasks	In addition to the Jump List category, a Pinned Site can predefine a list of tasks in metadata. This list is static.
Thumbnail toolbar	A Pinned Site can create up to seven buttons that appear on the taskbar thumbnail window. These buttons can be visible or hidden, active or inactive, or toggle between different button states.
