

Let's look at a real-world example of site pinning. If you go to www.consumermate.com and right-click on the Taskbar icon, you will see a Jump List like this:

Now, you will notice that the Consumermate pinned site Jump List has Laptop prices in the Tasks list. This takes you straight to the prices without having to navigate to the page from the address bar.

Now, let's look at how to code a Jump List category. First, we need to create a new Jump List category. To do that, use the `msSiteModeCreateJumpList` method in JavaScript. It takes a single parameter, which is the name of the Jump List category that will be displayed to the user.

```
window.external.msSiteModeCreateJumplist('Resources');
```

Next, we need to create items in this Jump List category. This is done by the `msSiteModeAddJumpListItem` method. This method has 3 required parameters, which are the same trifecta as when we were putting items in our Jump List tasks:

name – This is the name of the Jump List item which is displayed to the user in the Jump List.

action-uri – This URI is the destination that the user will be taken to when the Jump List item is clicked.

icon-uri – This URI is a pointer to an icon (*.ico file) that will be displayed to the left of the item name in the Jump List.

You will probably want to add multiple items to your Jump List category, using the same code below with different content:

```
window.external.msSiteModeAddJumpListItem('Twitter',  
    'http://www.twitter.com/consumermate',  
    'http://a3.twimg.com/a/1294164987/images/iefavicon.ico');
```

Next, we have to call `msSiteModeShowJumpList` to display the Jump List with our new items.

```
window.external.msSiteModeShowJumplist();
```

Finally, if you ever want to remove your custom Jump List, you can do this by calling the `msSiteModeClearJumpList` method.

```
window.external.msSiteModeClearJumplist();
```

Putting it all together, the JavaScript might look like this:

```
// Jump list categories  
if (window.external.msIsSiteMode()) {  
    window.external.msSiteModeCreateJumplist('Name of  
the Category');  
    window.external.msSiteModeAddJumpListItem('Name of
```
