

- OpenGL® 1.5 supported graphics hardware for OpenGL® ES 1.1, and OpenGL® 2.1 supported graphics hardware for OpenGL® ES 2.0, with the latest version of the graphics card driver.
- ▶ A bada membership, for downloading the SDK from the bada developer site and managing your application's life-cycle.
- ▶ Target mobile device for testing your application after first testing it with the Emulator in the IDE.
- ▶ To deploy your application to a mobile device, you need to create a connection between your computer and mobile device via USB.

Installing the bada SDK

To install the SDK (software development kit) on your computer:

1. Download the SDK installer, bada_SDK_<version>.exe, from <http://developer.bada.com/>.
2. Run the SDK installer.
3. Select the required platform binary, and click Next.
4. Click Install.
5. The SDK set-up wizard informs you when the installation is complete.

If the download fails due to a firewall or unstable network connections, you can download the desired components from the bada developer site into the directory where the SDK installer is located, and run the SDK installer again. To add more components to your SDK later on:

 1. Run the SDK installer.
 2. In the Program Maintenance window, select Modify and click Next.
 3. In the Choose Components window, select the required components and click Next.
 4. When the installation is complete, click Finish.

Starting the bada IDE

The bada IDE (integrated development environment) is part of the SDK and installed with it. When you start the IDE, you are prompted to define the path for the IDE workspace. The default location is in the folder where the IDE is installed. If you start with a new version of the IDE, do not use a workspace created for a previous IDE version.

Go to **Start > bada IDE**. When you start the IDE for the first time, it displays a welcome page with more information on bada and on developing with the IDE. On the welcome page, click the Workbench icon to go to the development view.
