

The following figure illustrates the Emulator control keys, and the Emulator menu which lets you easily control the Emulator environment.

To access the menu options, right-click on the Emulator and select:

- ▶ **Event Injector:** Provide artificial data and sensor readings for your application.
- ▶ **Rotate:** Switch between portrait and landscape modes, if the application supports rotation. The mode is set to Portrait by default.
- ▶ **Error Lookup:** Retrieve a system error message based on the entered value.
- ▶ **Update Content DB:** Register newly added data files (images, sounds, videos, or other media data) in the media directory, which emulates the mass storage mode, or in the MMC directory, which emulates multimedia card storage (this option works only on the idle screen).
- ▶ **Save to File:** Save the screenshot of the Emulator screen as an image file.
