

- ▶ **Copy to Clipboard:** Copy the screenshot of the Emulator screen to the clipboard.
- ▶ **Option:** Adjust the Emulator size with the Size option. The default size-scale of the Emulator is 0.5. Set the Emulator to remain on the top of other desktop windows with the Always on Top option.
- ▶ **Close:** Exit the Emulator.

If your application accesses media files in the device's Media directory, you must manually copy the media files to the Emulator's Media directory before running the application on the Emulator. The Emulator's Media directory is located in \<BADA_SDK_HOME>\Model\<Device_model>\Emulator\FS\Media.

UI builder

bada provides a UI Builder to design and create the application UI. UI Builder is a WYSIWYG (What You See Is What You Get) design environment for creating user interfaces (UI) for applications.

With UI Builder, you can create forms and all the user interface elements, that is, containers and controls, that you want the forms to contain. UI Builder stores the created forms as XML files into the project folder in the IDE.

You can also use UI Builder to create other kinds of application UI elements as separate resource files. Panels, pop-ups, and localised string resources can have their own resource XML files.

UI Builder has a dedicated toolbar in the IDE that provides additional time-saving design tools such as zoom, editing mode (set display to portrait or landscape), and align controls.
