

10. If you want your application to launch automatically with specific conditions, specify the launch conditions, and click Next.
11. Select the build configurations based on where the application is to be deployed, and click Next.
12. Check that the project summary is correct, and click Finish.

The new application project is shown in the Project Explorer view of the IDE, with default content in the application.xml file as well as in several project folders. The selected manifest file is also included in the project.

Creating a Flash application project

The following instructions are specific for creating the project with the bada Flash Based Application template. To create the flash application project:

1. In the IDE, select **File > New > bada C++/Flash Application Project**.
If the project option you want is not visible, make sure that you are using the correct perspective (bada C++). To switch perspectives, go to **Window > Open Perspective > Other** and select the perspective you need.
2. In the New bada C++/Flash Application Project window, define the project details as you would do according to the procedure for C++ application projects. Select the project type as bada Flash-based Application, and click Next.
3. Select the Default manifest file check box to use the default device configuration, or browse for the location where you have stored the manifest file that you downloaded from the bada developer site, and click Next.

For the purpose of getting familiar with the IDE and SDK, you can also create an application without registering it on the bada developer site. In this case, you need to use the default manifest file provided by the SDK. An application that is developed using the default manifest file cannot connect to the bada Server and cannot be signed or sold in Samsung Apps Seller Office.

4. Make sure that the path for bada SDK root matches with the location where you've installed the SDK and that the Model for developing your application is correct, and click Next. The SDK root path points to the latest installed SDK instance by default.
5. Check that the name of the project is correct, and click Next. You can also add vendor information and a project description.
6. Define a name, base class for the form, and the source Flash file, and click Next.

You must also browse and select the source Flash file. After you define the source Flash file, the related resource files (such as sound and images)
