

mentioned within the source file are shown in the field below. Select the files you need. The SWF source Flash file and the selected related files are automatically copied to your application project's /Res folder.

Be aware that the resource files stored in the read-only /Res folder cannot be modified. If the application needs to modify any resource files, they must be stored in the /Home folder, and the local file path of the Flash control, passed as a parameter in the `Flash::Construct()` method, must be updated to reflect the change in the resource file location.

7. If you want your application to support target devices with different display resolutions, select the Auto-scaling check box, and click Next.

Auto-scaling enables your application UI to automatically scale up or down to match the target device resolution. If you enable auto-scaling, make sure that you select an appropriate base resolution for your application.

8. If you want other applications to have read and write access to the /Home/Share2 folder of your application, add their application IDs and click Next.

9. Defining trusted applications enables you to share your application files with other applications.

Your application can define whether notifications are displayed as tickers or full messages, and whether an alert sound and badge are used with notifications. Select the options you need from the Notification list.

10. If you want to export the functionality of another application for your application, specify the provider ID, operation ID, and AppControl category, and click Next.

11. If you want your application to launch automatically with specific conditions, specify the launch conditions, and click Next.

12. Select the build configurations based on where the application is to be deployed, and click Next.

13. Check that the project summary is correct, and click Finish.

The new application project is shown in the Project Explorer view of the IDE, with default content in the application.xml file as well as in several project folders. The selected manifest file is also included in the project.

Creating a web application project

The following instructions are specific for creating the project with the bada Web Application template:

1. In the IDE, select `File > New > bada Web Application Project`
