

If the project option you want is not visible, make sure that you are using the correct perspective (bada JavaScript or bada C++). To switch perspectives, go to **Window > Open Perspective > Other** and select the perspective you need.

2. In the New bada Web Application Project window, define the project details as you did above.

For the purpose of getting familiar with the IDE and SDK, you can also create an application without registering it on the bada developer site. In this case, you need to use the default manifest file provided by the SDK. An application that is developed using the default manifest file cannot connect to the bada Server and cannot be signed or sold in Samsung Apps Seller Office.

3. Make sure that the path for bada SDK root matches with the location where you have installed the SDK and that the Model for developing your application is correct, and click Next. The SDK root path points to the latest installed SDK instance by default.

4. Check that the name of the project is correct, and click Next.

You can also add vendor information and a project description.

5. If you want to export the functionality of another application for your application, specify the provider ID, operation ID, and AppControl category, and click Next.

6. Check that the project summary is correct, and click Finish.

The new application project is shown in the Project Explorer view of the IDE, with default content in the application.xml file as well as in several project folders. The selected manifest file is also included in the project.

bada project templates

The bada IDE provides various project templates that make it easier for you to start coding your application. When you create a new project, you can select from the following templates:

► bada Form-based Application

This template is suitable for creating a simple project based on a form. The template contains the basic application functionality as well as the functionality for drawing a form on the device screen.

► bada Flash-based Application

This template is suitable for creating a simple project based on a flash file.
