

File Structure of a bada App

Adding libraries and library search paths

In the project properties, you must define all the libraries that you use in your application, as well as their search paths. The libraries required for using bada APIs are listed under Remarks in the C++ API Reference. The default bada library, FOSP, is added automatically to the list of libraries by the Application Wizard, but you need to add the other libraries manually.

For example, if your application uses OpenGL® ES, you must include FGraphicsOpengl and FGraphicsEgl in the library list as shown under Remarks.

Necessary libraries

If you use any external libraries in your application in addition to those included in the bada SDK, you also need to define these libraries and their search paths in the application project properties. You can store the static libraries anywhere in the file system of your computer.
