

DESIGNING AND CREATING THE APPLICATION UI

Your application's interface is critical. Here are points for you to remember while working on the UI.

All bada applications have an application UI. The UI provides the form on which you present all your application's information. In order to maximize user experience, you must carefully design and create your application UI.

The UI of a bada application consists of one or more application screens. Each screen is represented by the `Osp::Ui::Controls::Form` (in the C++ framework) or `Osp.Ui.Controls.Form` (in the Web framework) class, containing an indicator bar, header, and footer. In addition to these, a form contains controls, which can be simple controls or containers that can contain other controls. The simple controls (such as buttons and edit fields) and containers (such as panels and pop-ups) represent actual user interface elements.

All the forms of an application need to be attached to the `Osp::Ui::Controls::Frame` (in the C++ framework) or `Osp.Ui.Controls.Frame` (in the Web framework) class, which is the top level window of the application.
