

The bada developer site and Samsung Apps Seller Office provide you with convenient tools to manage the life-cycle of your mobile application once it is in operation. If you want to upgrade your application after certification, see Upgrading Applications. If you want to withdraw your application from distribution and operation, you need to request for application retirement on Samsung Apps Seller Office.

Upgrading Applications

You can make upgrades to your application even after you have certified it at Samsung Apps Seller Office and it is on sale at Samsung Apps.

To upgrade the application:

1. If you have changed the development environment or API version of the application, check the Application Migration Guide for detailed instructions.
2. Update your application version and download an updated manifest file from the bada developer site.
3. Update the application code as needed.
4. If needed, update privileges groups and download an updated manifest file again from the bada developer site.
5. Build, test, and repackage the application.
6. Register the upgraded application on Samsung Apps Seller Office.

When a previously installed application is upgraded on a device, you can decide which data files from the old version are kept and which are deleted. The common bada upgrade policy is to overwrite all the application package files, while keeping the user-created files and directories.
