

HELLOWORLD

Hello World is a term all developers are familiar with. Here you'll find the standard procedure in building your first app

Creating a HelloWorld application

1. Define your application details on the bada developer site and download the manifest file.

For the purposes of familiarizing yourself with the IDE and SDK, you can create the HelloWorld application without registering it on the bada developer site. When creating an application without registration, use the default manifest file provided in the SDK.

2. Creating the HelloWorld Project
 - a. Launch the IDE by selecting `Start > Programs > bada SDK > badaIDE`.

Create the application project in the IDE.

- b. During the project creation, define HelloWorld as the name of your project, select the project type as Form Based Application, and select the downloaded manifest file (if you downloaded one in the previous step). For all other values, use the default values in the application wizard.
3. The new HelloWorld project is shown in the Project Explorer view of
