

INTRODUCTION

This Fast Track will help you get started with bada and provides all the information you need to set up the development environment and get familiar with the application development process and developer tools.

First we introduce the bada platform in terms of its architecture and C++ and web frameworks. Next, we look at the prerequisites for using the bada SDK (software development kit), and contains the installation instructions for the SDK.

After that we explain how to use the bada SDK and various bada IDE (integrated development environment) tools when developing bada applications. We also take a deeper look into the application development process for managing your application's lifecycle from product conception, through development and release, to end-of-life application retirement.

Next we have detailed information on general bada SDK features, such as application UI design concepts and application migration between API releases. There are also guides to get started with C++, Flash and web based programming for bada. We end with a guide on using OPENGLES 2.0 on bada 2.
