

the width and height parameters of the screen by switching the orientation based on the orientation status of the device.

```
void ImagePanel::OnOrientationChanged(const Osp::Ui::Control
&source,
•
•                               Osp::Ui::Orientation
Status orientationStatus)
• {
•     Form *pForm = static _ cast<Form *>(GetParent());
•     if(pForm)
•     {
•         Rectangle clientRect = pForm->GetClientAreaBounds();
•         Rectangle rt(0, 0, clientRect.width, clientRect.
height);
•         SetBounds(rt);
•     }
• }
```

## Create the Privilege panel

1. The Privilege panel attempts to use methods that require certain privilege groups, and tests whether these methods have the required privileges.

The `Initialize()` method creates four labels and two buttons to test for access to privilege groups.

```
result PrivilegePanel::Initialize(Osp::Graphics::Rectangle
rect)
• {
•     result r = E _ SUCCESS;
•     Panel::Construct(rect);
•     // Create a label
•     Label *pLabel1 = new Label();
•     pLabel1->Construct(Rectangle(250, 205, 180, 50),
L"Result");
•     pLabel1->SetName(L"Label1");
•     pLabel1->SetTextVerticalAlignment(ALIGNMENT _ MIDDLE);
•     pLabel1->SetTextHorizontalAlignment(ALIGNMENT _ CENTER);
•     AddControl(*pLabel1);
•     // Similarly, create Label2 for "Result"
•     Label *pLabel3 = new Label();
•     pLabel3->Construct(Rectangle(25, 100, 440, 50), L"With a
privilege");
•     pLabel3->SetName(L"Label3");
```
