

HELLOFLASHAPP

All you need to know so you could create a Flash application for your bada device

This chapter demonstrates how you can create a simple HelloFlashApp application. We'll look at familiarising yourself with the bada application development process as well as with using the bada SDK by creating a simple HelloFlashApp application that contains the basic bada Flash application functionality and displays a form on the device screen.

Creating a HelloFlashApp application

1. Creating the Application profile

Define your application details on the bada developer site and download the manifest file. To use the Flash based application template in your project, the `FLASH _ SERVICE` and `SYSTEM _ SERVICE` privileges are required. (The `SYSTEM _ SERVICE` privilege is needed because the Flash based Application template contains privileged methods by default.)

For the purposes of familiarising yourself with the IDE and SDK, you can create the HelloFlashApp application without registering it on the bada developer site. When creating an application without registration, use the default manifest file provided in the SDK.

2. Creating the HelloFlashApp Project

- a. Launch the IDE by selecting `Start > Programs > bada SDK > badaIDE`.
