

Architecture of bada

are provided by the device operating system, graphics and multimedia functionality, and communication components. These functions include, telephony, security, graphics, and event and window management.

Service

This layer contains the service-oriented functions that are provided by application engines and server-assisted components. The application engines provided by the service layer include Contact and Messaging engines. The server-assisted features are provided by RESTful web-service components that interconnect with the service components of the bada Server. The service layer enables applications to manage data that is stored on remote servers, such as geographic information and user presence information. Access to the server-assisted features is possible through APIs (application program interfaces) on the Framework layer.
