

```

    },
    text: "Change label text",
    actionId: this.ACTION_ID.BUTTON_PANEL
  });
  this.labelButton.setTextSize(this.BUTTON_TEXTSIZE);

  this.demoLabel = new Osp.Ui.Controls.Label
  ({
    bounds: {x: 30, y: 80, width: 250, height: 100},
    text:"Button"
  });
  this.demoLabel.setTextColor('white');
  this.demoLabel.setTextSize(this.LABEL_TEXTSIZE);

```

The `addControl()` method is used to add the label and button to the panel and the panel to the form. The `addListener()` method adds an event listener for the button, so that the application can react to the button presses.

The `setCenterAligned()` and `setRelation()` methods are used to define how the button and label are placed on the screen in the relative layout. The button is set to be both horizontally and vertically centered on the panel, while the bottom of the label is set to be aligned with the top of the button.

```

  this.buttonPanel.addControl(this.demoLabel);

  this.buttonPanel.addControl(this.labelButton);

  this.labelButton.addListener('actionPerform',
                                this.actionPerformedButtonPanel, this);

  this.basicForm.addControl(this.buttonPanel);

  this.relativeLayoutButtonPanel.setCenterAligned(this.
labelButton,
  Osp.
Ui.Controls.HorizontalAlignment.CENTER);
  this.relativeLayoutButtonPanel.setCenterAligned(this.
labelButton,
  Osp.
Ui.Controls.VerticalAlignment.MIDDLE);

```
