

- `cOrientation = this.basicForm.getOrientationStatus();`

If the orientation is set to landscape, the orientation button bounds are changed. The horizontal and vertical alignment of the button is set relative to the layout of the panel using the `setCenterAligned()` method. This method allows recalibrating the position of the button in landscape mode.

The change from landscape to portrait mode is handled similarly.

- `if(cOrientation == 'landscape')`
- `{`
- `// Set the button bounds`
-
- `this.relativeLayoutOrientationPanel.`
- `setCenterAligned(this.orientationButton,`
-
- `Osp.Ui.LayoutHorizontalAlignment.LAYOUT _ HORIZONTAL _`
- `ALIGN _ CENTER);`
-
- `this.relativeLayoutOrientationPanel.`
- `setCenterAligned(this.orientationButton,`
-
- `Osp.Ui.LayoutVerticalAlignment.LAYOUT _ VERTICAL _ ALIGN _`
- `MIDDLE);`
- `}`
- `else`
- `{`
- `// Handle the button when changing to portrait mode`
- `}`
- `},`

Create the image panel

The Image screen demonstrates the use of images in bada web applications.

Similarly to the `buttonPanel` panel, the `imagePanel` panel contains a relative layout and a label. However, in this panel the label contains a background image, which is set using the `setBackgroundImage()` method. This method takes as an input parameter the image location path.

- `createBodyImagePanel: function()`
- `{`
- `// Layout and panel are created here`
-
- `this.demoLabelImagePanel = new Osp.Ui.Controls.Label`
