

OPENGL ES 2.0 ON BADA

bada has added support for OpenGL
graphics support with version 2.0

This chapter, based on the GlesCube sample delivered with the bada SDK in \<BADA_SDK_HOME>\Samples\GlesCube, demonstrates how you can use the `Osp::Graphics::Opengl` sub-name-space to create a 3D cube using OpenGL® ES 2.0 and EGL™.

This sample is a fully functional application for extending the functionality of OpenGL® ES 2.0 on the bada platform to create a spinning 3D cube. OpenGL® is a standard specification defining a cross-language, cross-platform API for writing applications that produce 2D and 3D computer graphics. OpenGL® ES 2.0 enables 3D graphics design with shading capabilities. EGL™ acts as an interface between OpenGL® and bada.

The application includes the `Form (_pForm)` UI control, and no interactive UI elements. When the application starts, a spinning 3D cube is drawn on the form.

The GlesCube sample application uses the bada Form Based Application template, which contains a preset `Osp::Ui::Controls::Form` class. Most methods used in the sample remain as they were created in the project template.
