

Real-time Photoshop effects using filters, Vignette Effect

The effect will basically be used to add a colour cast, like warmth to a cloudy day to make it appear more like during sunset, or to correct an unrealistic one. Since most digital cameras automatically adjust for white balance, and this can also be changed afterwards using editing tools, these filters are slowly becoming redundant. Yet unusual lighting situations or underwater photography are only some examples which necessitate the use of this filters in scenes where an overwhelming amount of monochromatic light is present that no amount white balance can restore to full colour without introducing significant image noise in some colour channels. Another types of filters popular earlier but overshadowed by widespread adoption of digital photography today are colour correction filters and colour enhancement filters. In black and white photography filters are commonly used to manipulate contrast, as a matter of artistic preference or of necessity. Broadly speaking, filters generally lighten up objects of their own colour and darken those of their complement, with complementary colour pairs being green & red, orange & blue, violet & yellow etc. for instance a green filter will lighten up green foliage to show more details in outdoor photography while also providing more pleasing skin tones, especially against blue sky.

Now that we have seen the different types of filters at our disposal, it is also important to understand both sides of the coin before rushing to experiment too much as they can have an adverse affect on the image. Using a filter means you are effectively introducing an additional piece of glass between the camera's sensor and the subject, potentially leading to reduced image quality. This usually comes in the form of either a slight colour tint, a reduction in local and overall image contrast, or ghosting and increased lens flare due to light inadvertently reflecting off the inside of the filter. Another problem you may face is physical vignetting in pictures, leading to dark-
