

Now we can see what the sensor sees either on a screen, or through an electronic finder. With the mirror gone, the body can be a lot smaller, just like a compact digicam. This means you can carry it with you everywhere, fit it in a jacket pocket and be ready for *that* picture, wherever you are.

EVIL offering from LUMIX

Compact DSLRs do away with the mirror box assembly and pentaprism required with the optical view finder (OVF) of traditional DSLRs. Eliminating the mirror box allows the main camera lens to be moved closer to the image sensor, and the diameter of the main lens to be reduced, reducing the overall size of the camera dramatically. One obvious and important way compact dSLRs differ from traditional DSLRs is - they don't have an OVF. Instead,

How the ray moves inside the camera
