

played along with books and interviews by the grandmaster – and this time around, Deep Blue won.

Computers started consistently beating humans from this point on. And it's not like the computers were winning by taking their own sweet time to analyse each move. In 1998, the undisputed champion of rapid chess, Vishwanathan Anand, faced off against Rebel 10 in blitz chess matches and lost.

The advances in artificial intelligence in the field of chess had gotten so fast at this point that in 2000, it didn't require supercomputers like Deep Blue to play against the world's grandmasters. Fritz, a commercially-available chess program, managed to draw against Kasparov. However, many said Kasparov was well past his prime at this time.

The next big human-computer chess matchup came in 2002, when the world's highest ranked player Vladimir Kramnik took on Deep
