

Architecture of an AI engine

- ▶ The AI engine follows the Architecture shown in the graph:
- ▶ Perception: Perception of the AI Engine is programmed to sense vision, dialogues and other inputs from the environment in the game world. This contains all the libraries which will make an NPC perceive what is happening in the game world.
- ▶ Decision: This contains libraries which will help the AI programmer to program the core AI which include rules/learning process.
- ▶ Action: A set of libraries which defines the various types of actions, an NPC can perform.

Dynamic shadowing techniques used in Cry engine

Audio engine

- ▶ Some Game Engine APIs come with Audio Manage in-built. Example XACT for Xbox.
- ▶ This will take care of the sound design and game music.
- ▶ To get more information on Game sound and Music, go to Audio Design section of this chapter.

Animation engine granny

Networking engine

- ▶ This part of the Game Engine API, allows multi-players to play together with a shared virtual world.
- ▶ Data can be transferred between players/computers.
