

The first step is to connect to your SkyDrive-based document repository, which can be found at office.live.com on either the PC or the phone. You'll need to use Internet Explorer to access this site, and then log on with your Windows Live ID if it's not already set to auto-login.

What you'll see here will vary depending on whether you've ever used or customized the site. If you're new to SkyDrive from an online document perspective, it will be empty but for a few stock folders like Personal and Shared. Otherwise, you'll see a list of folders and documents.

To view a Word, Excel, or PowerPoint document in a scaled-down,

read-only mode, navigate through the SkyDrive interface and then tap on the appropriate file. It will display right in the browser, using a very limited version of the Office Web Apps. The ability to view Office documents directly in the browser is a good one, but it's limited in that complex documents especially Excel spread sheets and PowerPoint presentations don't display in very high fidelity. To overcome this, and view the document in a more capable Office Mobile application, you can download it to the phone.

To do so, click the prominent Download link at the top of the page that's displaying the Office document. This will trigger the interesting display. Then you can tap the icon as instructed to download the file. From here, you can of course view the document in a much higher fidelity environment than is made available through Internet Explorer. If you tap the Back button, however, you'll return back to IE, and the document will not be saved to the phone.

You may want to save the document to your phone, however. To do so, tap More and then Save As. This will display the Save to Office Hub screen. Rename the document if needed and then tap Save.

To see that the file is saved, tap Start and then launch the Office hub. If you scroll over to the Documents section, you'll see that the saved document is now at the top of the list.
