

connected to the server.” That way, you can ensure that you have an offline copy to work on should you be in a disconnected state. To do so, browse a SharePoint library and find the document you’d like to mark. Then, tap and hold on the document name and choose Always Keep Offline from the pop-up menu that appears. This will ensure that the document in question is kept on the phone. Changes you make to this offline document will still be synced to the server. So if you’re connected when the changes occur, it will be synced immediately. Otherwise, changes will sync when you are later connected.

Configure Office Mobile

If you take a peek at the Settings interface for Office (which is listed as Office 2010), you’ll find a couple of useful items to configure. These include:

- ▶ **Username:** Office Mobile is supposed to pick up the name of the registered phone user but has never actually done that in my experience. If you haven’t yet configured this information Office Mobile will ask you if it needs it you can do so here.
- ▶ **SharePoint:** There are numerous options related to SharePoint Workspace Mobile, including a way to clear the cache and thus delete all temporary SharePoint files and history, a simple file conflict management interface, a way to configure the phone for Forefront Unified Access Gateway (UAG, Microsoft’s server-side security product—your administrator can provide this information if it’s needed), and more.
- ▶ **OneNote:** Here, you can determine whether OneNote Mobile automatically syncs notes with Windows Live SkyDrive. It’s a simple On/Off option, and when it’s set to On, notes will sync anytime you open a note page, save a note page, or open a note section.
