

ranged cameras from (surprise, surprise) Canon. It can give your camera professional (read: expensive) level features, and then some. Run-of-the-mill qualities such as shooting in RAW mode, manual control over the exposure, zebra mode, live histograms, grids, etc. are included, as are some fantastic ones such as controlling your camera with a remote, scripting to add your own requirements to the feature list, and many, many more - there are games too! There is another, slightly less popular hack called 'Magic Lantern' - again for Canon. Along with these two, there are many other firmware hacks available, while others are in some or the other levels of development, for various manufacturers. Expect to see some action in this field in the coming time.
