

corporation. Dystopian scenario for a true hacker, we say.

4) BlackBerry

BlackBerry hacks, to be honest, are not that popular. And that is precisely the reason that one should be very, very sure before hacking into their device – you would practically be alone in the pursuit, and would not get much in the name of support, advice, and if need be, troubleshoots around – even on the internet. BlackBerry doesn't offer the most capable of devices anyway, and as we know, no hack can provide you a feature if the hardware cannot support it. Also, as BlackBerry recently announced, it does not condone the act of hacking into a BlackBerry, and along with the usual risks of bricking and voiding your warranty, there is a possibility that future support is denied to such devices. Also, it then becomes paramount to shell out a few bucks on getting a competent anti-virus software, because BlackBerry is a platform whose whole empire was built on secure communication, and that is something you'd not want compromised.

5) Symbian

Hacking the S40 platform:

You thought we'd forgotten about this, didn't you? Apparently, this is still among the most popular phone platforms in India. And it can be hacked. Which is why we must tell you the hazards for the same. The main reason

that people hack their Symbian S40 devices is to break off some of the OS limitations discussed previously, but because S40 runs on low powered devices, it is essentially a case of trading features. Like, if you go in for a hack to avail multitasking, then you are essentially giving up the possibility of using resource

intensive apps like a 3rd party browser, or video playback, because a section of the memory is then reserved for multitasking support.

Hacking the Belle platform:

One of the most important reasons for not hacking could be that it wouldn't be worth it. Belle (or for that matter, Anna its predecessor), as a platform,
