

screen that looks something like this.

Note: Windows users should run Absinthe with administrator privileges. Right click the file, switch to the “Compatibility” tab from the top and enable the “Run this program as an administrator” check box. Additionally, check the “Run this program in compatibility mode” box and select Windows XP from the drop down.

The Absinthe tool allows you to Jailbreak your iOS 5.1.1 device.

Step four:

Connect your iPhone to your PC/Mac via USB and make sure you don't have passcode lock enabled. If you do, you can temporarily disable it, and enable it again once you're done with the jailbreak process. Absinthe should detect your iPhone and display the firmware it's on. To be double sure, check that the firmware is 5.1.1.

Step five:

It's a pretty easy ride if you've made it till here (not that the earlier steps were too difficult). Hit the “Jailbreak” button. Absinthe should now start the jailbreaking process, updating the progress bar and taking you through the various stages of the process. Here are the stages:

1. “Beginning jailbreak, this may take a while”
2. “Sending initial jailbreak data. This may also take a while”
3. “Sending initial jailbreak data. Your device will appear to be restoring a backup, this may take a while”
4. “Waiting for reboot...not done yet, don't unplug your device yet!”
5. “Waiting for process to complete”
6. And finally when the whole thing is done “Done, Enjoy!”

Once the last message appears, you can safely unplug your device.

Step six:

Although your iPhone has been jailbroken, there's one more thing you need
