

Symbian Hacking

Tools you'll need

There are a wide assortment of tools available for modifying or “cooking” your Symbian firmware. Here are some of the most popular ones. You'll only need to use a few tools out of these depending upon the task to be accomplished.

► NaviFirm+

The very first thing you'll need is your firmware if you wish to “cook” it and NaviFirm gets it for you. It has an extensive database and you'll find the latest firmware for your phone as and when released. Also it downloads all the files from official Nokia servers.

► Notepad++ along with the Hex Editor plugin

A Hex editor allows you to modify binary files and since Notepad++ happens to have a plugin for one, one might as well go in for it. If you wish to use a separate tool then any Hex editor like XVI32, HxD, Hex Workshop etc. can get the job done.

► Nokia Cooker

It allows you to modify the contents of your firmware to help create a custom firmware. It can modify UDA, CORE (only ROFS1 data), ROFS and ROFx data. One can add/remove content from the firmware using this tool. The safest option is to modify the UDA data, the rest are a bit risky given that the likelihood of bricking your phone increases unless done properly on CORE, ROFS and ROFx(ROF2, ROF3, ROF4, etc.).

► Phoenix Service Software

Nokia's very own software that is used to “flash” or write the firmware onto the EEPROM(flash memory). It requires a dongle to authenticate the software though everywhere we looked we found the cracked version of the software being used, so use with caution. It is feature rich and frequently updated as and when Nokia releases new phones.

OR

► J.A.F. by Odeon

Just Another Flasher is one of the many third party tools available for flashing DCT3, DCT4, BB5 phones. Though now defunct, it still works great, though newer phone models are not supported and you'll still have to use
