

Phoenix Service Software for that. And if you are using 64-bit Windows then get the proper 64-bit drivers, otherwise do not attempt flashing using this software.

▶ **Symbian SDK**

Needless to say the SDK allows you to write your own applications that you can install on your phone. Though programming is the hardest way of getting into your phone it is also the most fulfilling.

▶ **Carbide.ui**

Not a hacking tool but one that allows you to build your own theme and UI for all Nokia Symbian devices.

▶ **Nokia Firmware Editor**

Another software to modify ROFS2 and UDA firmware files. Pretty useful for removing the built-in applications.

▶ **Sis Contents/SIS Explorer/SISware**

Nifty tools to extract and create SIS packages for different Symbian versions.

▶ **Petran GUI**

Included as part of Symbian SDK to convert PE (Portable Executable - Windows executable format .dll & .exe) files to Symbian OS executable format.

▶ **Mediabar Editor**

A tool specifically for editing the Mediabar present in phones like Nokia 5800.

▶ **File format converters**

You'll need a host of file format converters like SVG to SVGB / SVG to DAT / SVG to SVG-T / (PNG, JPG, JPEG, GIF to MIF) / Bitmap(BMP) to Multibitmap(MBM) etc.

Though software like Adobe Illustrator and Photoshop will get most of the job done, these command line tools get the job done much quicker.

▶ **ROFS2 Language Tool**

Allows you to skip editing the resource/bootdata/languages.txt manually. Just point to the ROFS2 file and select which language you want removed.
