

by keying in the code `*06#` or by checking the battery compartment or by checking the device packaging.

4. It'll take upto 24 hours to obtain your certificate, you'll be notified by email when your certificate is ready.
5. Once you have obtained the certificate, download SignTools 2.2 from their forums <http://www.s60certificatekey.com/forum/index.php>.
6. You'll obtain a .cert file and a .key file from the website, use them to sign your application using SignTool.
7. You now have a signed application which will install on your device without any problems.

This method needs to be repeated for each new application that you install, alternatively you can use HelloOX2 from <http://helloox2.com/>

HelloOX2

Get the unsigned HelloOX2.v2.03.sis and repeat the above steps to sign and install the application on your mobile device. Once installed, run the program and it will automatically do the following..

- ▶ Map C:\sys\bin\ to a virtual drive
- ▶ Unpack hacking files to the virtual drive
- ▶ Activate the file system
- ▶ Unmap virtual drive
- ▶ Install

root certificate

- ▶ Install ROMPatcher
- ▶ Optional Install Modo (an unlimited access file manager)

ROMPatcher has multiple patches which can be enabled or your ROM can be "patched" to enable certain features. There are a few variants available, the Original by ZORn and

another at Symbian-Tools are equally good. Plenty of documentation has been provided about creating your own patches to enable extra features on your phone, all depending on your programming skills. All patches are applied
