

using a memory hack, that is, the ROM is mapped to certain sections of the RAM and all modifications are made in the mapped RAM. This is reflected in the ROM virtually and the hack is enabled. Thus, these hacks are not permanent and you do not risk messing up your phone. Just reset your phone and it will be returned to its prior state. Any extra patches which you wish to apply must have an .rpm extension and should be placed in the patches folder.

Apply the InstallServer patch to allow unsigned applications to be installed on your phone without going through the hassle of signing each and every application.

All modifications that HelloOX2 makes to your phone can be enabled disabled via the application as and when you need to.

Norton Hack

If you don't want to get into flashing and risk your phone getting bricked, you can opt for a simple method known as 'Norton Hack'. Follow this procedure, and you can install whatever you want. (We have tested on Nokia 701 but it is compatible with all s60v3,v5 and Symbian^3 devices)

1. Download Norton Antivirus and RomPatcher package.
2. Install the application. Ignore the 'Application not compatible error' if any, while installing. Now launch the application. It should look something like this
3. Now go to Options-Quarantine list.
4. Now again go to Options-Restore all. Confirm it
5. Now install the other file in the package, RomPatcherPlus_3.1_LiteVersion. Launch the application
6. You will see an open4all patch. Apply this patch. After this, you can access all the system folders of your phone through file manager.
7. Another patch in the download package is Install Server1.7RP+.rpm You need to extract this file in E:/Patches (create the folder if it doesn't exist) of your phone's external memory. Apply this patch in the same way as before and there won't be any kind of certificate errors while installing apps and games. Your Rompatcher screen will look like this after patches are applied. There are many patches available on net as you can see in
