

Once you've built your own FBUS cable all you have to do is figure out your phone's pinout diagram which is a google search away. They usually appear like a bunch of 4-5 brass contacts clumped together behind the battery compartment.

Here is a chart for your reference, always confirm first before connecting your device via FBUS as FBUS operates on a higher voltage and will fry your device if connected to the wrong pins.

Once your phone is hacked, you will be able to install all the mod files on your phone which will help you change your theme effects, start-up sound and logo and improve customization features. But to improve the performance of your phone, flashing is a better option. Also, the above method will retain hack only as long as your phone is formatted. Once you restore your default settings, your phone will be un-hacked the way it was. To get it permanently hacked, flashing is recommended. Also, if you guys are facing 'Component built-in' error in Belle FP1, there is no other way to remove it besides flashing.

But before you flash your phone, don't forget to backup your data on phone memory. This will include contacts, messages, notes, calendar events and tasks and bookmarks and feeds. Nokia PC suite is quite handy to sync your data with computer and take a backup. But if you have an older version of Nokia PC Suite, you can even copy-paste your contents to PC if you find that easier.
