

and-shoot cameras where the image that the photographer sees is not what passes through the primary lens of the camera. DSLRs offer manual control over camera settings, but are usually heavier and expensive.

What we mean by hacking?

Your camera contains a tiny computer. The firmware of your camera tells the computer how to run different functions on your camera. When we say hack your camera, we mean firmware enhancement. This is similar to hacking any other device. Installing a custom firmware in your camera will improve its functionality; give you features which the stock firmware that came with your camera would not provide.

CHDK for your Canon point-and-shoot

Enhancing your Canon point-and-shoot camera's firmware will give it DSLR like features. The Canon Hack Development Kit(CHDK) is a firmware enhancement that operates on an array of Canon PowerShot compact cameras. It adds to your camera's functionality beyond that provided by the stock firmware. It gives you more manual options and features like RAW shooting mode, motion detection and time-lapse on your point-and-shoot.
