

- ▶ **Enhanced Image Capture:** CHDK adds support for two RAW formats - DNG and CHDK RAW. DNG is a popular industry standard whereas CHDK RAW is a dump of the entire sensor data, so it varies from camera to camera. Longer recording time or length for videos (up to 1 hour or 2GBs), and several new compression options are also offerings that CHDK brings along.
- ▶ **Modify the user interface:** Using CHDK, your camera's UI can be modified to your liking. Features include numeric battery life meter, a detailed live histogram, multi-lingual interface with 22 languages etc.
- ▶ **Additional Settings:** If your hardware can support it, then CHDK tries to make it happen CHDK expands the capabilities of your camera like greater control over exposure timings with flash-sync(2048 seconds to 1/60,000th of a second), motion detection sensitive enough to capture lightning, faster shutter speeds (1/25,000 sec or faster), automatic bracketing of your photos, and more.
- ▶ **Support for Small Programs/Scripts:** If you can script in ubasic or lua then you pretty much have unprecedented control over your camera's capabilities. You can toy around with all its features by making use of the many user contributed scripts already available on the forums and hobbyist web sites.
