

establishments that he was preparing and the supplies that were recovered after his death. The plans could not be recovered, because they lay mainly inside his head (eidetic memory, no kidding), along with many other crazy awesome plans to make the world a supremely advanced place. It's a shame he died early, and broke, and crazy, but let's leave that story to another day.

Now, onto his contributions to the green cause. He was the first person to build a hydroelectric power plant (cheers to our dear friend AC), and prove to the world that this could prove to be a chief provider for our future electrical needs (something that we're yet to properly implement). He was also a great thinker for the cause, and publicly denounced the heavy usage of non-renewable sources of energy. To quote him, "Whatever our resources of primary energy may be in the future, we must, to be rational, obtain it without consumption of any material." That was an incredible bit of forward thinking from the man who died before the first known shortage of oil (1970s). Tesla also did a lot of research work aimed at making a dif-
