The broad definition of cyber-terrorism

We're pretty sure that we convinced you enough that under certain circumstances, the electronic medium can be used to create conditions potent enough to breed fear in the hearts of the general public. Now think about another question: "what if more than one services are disrupted on the same day?"

Let's stretch our imagination a bit more and assume that the traffic system of the area where our imaginary guy Yash lives in, is disrupted and at the same time the mobile phone network service he has subscribed to is down for some reason. In case of a traffic jam, the possibility of Yash calling up his office and informing that he is stuck in a really bad traffic jam is very high. But on that day he would not be able to since the phone networks are also down. This situation would not be applicable to only Yash, but to all those people who wanted to go in the same direction and were using the same mobile phone network.

Large networks are more difficult to penetrate into - you are safe! (A simplified view of a UMTS network)
