

FLARToolkit

FLARToolkit is based on ARToolkit. The development of original library (ARToolkit) appears to have stopped as the last release was back in 2007. However, FLARToolkit is still breathing and alive. The project is available online at <http://www.libspark.org/>. The website is in Japanese and the only way you can use it well enough is by using Google Translate. There is a discussion forum which is in Japanese too, unfortunately. The library has been utilised in quite a number of programs. If you are willing to use it, the official site may not be very useful (we assume you do not understand Japanese). However, help is available elsewhere by people who have used the library to create their own apps.

Wikitude

Wikitude is an AR based location browser app. As a developer it offers you SDKs for Android, iOS and Blackberry. You can develop apps in one of these or deploy using web technologies (HTML, JavaScript and CSS). There are multiple versions of the SDKs and you have to buy a license for the platform before you can publish the app. Once again, you have documentation and discussion forums to help you with.

Wikitude SDK is not free enough

To sum it up...

While there is no dearth of frameworks for almost any purpose, it is better to start-off with open source libraries. If you have not programmed an AR application before, the open source nature of the libraries would help you understand the underlying concepts, and guess what, you cannot skip the concepts even if you are using an AR library.
