

If your aren't targeting a mobile platform, OpenCV is the best bet in the free world, and IN2AR if you are ready to pay. There are many other frameworks and libraries which we have not mentioned because they are either immature or their development has stopped long since. Also, before we end, we would like to emphasise on planning. Most AR applications are being targeted for mobile phones. If you too are going to develop for mobile phones, choose your target platform(s) wisely. Even more importantly, you should choose the framework which is known to work with the platform well enough. If the planned platform (and we do not just mean the OS, the device which you are going to test your application upon matters as well) does not support the technologies, amount of effort needed will rise.

*We wish you a very Happy New Year ahead as we sign off.*
