

The start screen on a 1920x1080 monitor

application tiles keep changing what they show. Each tile is like a small peek into the application; your mail app can show the latest mail and unread mail count, your news app can show the latest news clip with their leading image; an eBook reader can show which book you are currently reading.

This small feature also means that for some apps you don't even need to launch them to see if there is anything new. If your mail app shows there are no new mails, you needn't launch it.

The start screen isn't just limited to apps either, it can also link to other kinds of content. Apps can pin content here as well. For example, Internet Explorer can pin websites here, the Kindle app can pin books here, and the People apps can pin Contacts here. It's just a convenient way to access content directly rather than going through the app.

At the top-left of the start screen you will also see the name and photo of the currently logged in user. Clicking on this shows a menu that can be used to change the account picture, lock the computer or sign out.

Managing Tiles

There a number of things you can do on your start screen to keep things organised. The simplest and most obvious being that you can drag tiles around to rearrange them.

Tiles can show the latest data available to the app
