

Tiles for Modern UI apps can be displayed either as a normal square tile, or an expanded rectangular tile that takes up as much space as two tiles. As we said before, tiles can show information from an app, so you can use this with tiles that have important data to display.

To perform operations on a tile, you need to select it first. If you are using a touch screen, slightly slide the tile in a up-down motion, this will select the tile, mouse users can just right click. For keyboard users you first need to navigate to the tile using the arrow keys, and then press the space key to select the tile. A bar will pop up at the bottom with command for the tile.

For all tiles you will see an option to unpin the app from the start screen or uninstall the app. For Store apps you will also get an option to change the size of the tile, and to turn off live updated for a tile. For desktop icons you will be able to launch the app as an admin, open the location of the shortcut, open a new window of the app, and to pin the app to the task bar.

The start screen shows apps in rows and columns, but the way these icons these behave needs to be understood. As you start adding tiles to the start screen, they will come in rows of two.

When the maximum number of rows in a column is exhausted, another column starts.

If you drag a tile away form a column, to the left or right, at one point a column of space will appear highlighted, and you will be able to start a new group of tiles.

You can have a number of such groups. Unlike the old start menu there is no system of folders on the start start screen, so having hierarchy is not possible. Instead you can group tiles for similar apps together. It is even possible give a name to these groups. So you can group together all your photo editing apps under the heading “Photo Editing”, or for example all your internet related apps under “Internet”.

To make managing the start screen easier, there is a zoomed out view available. In this view you can move around entire groups, and name them. This zoomed out view is accessible by using the zoom (pinching) gesture on the start screen. To reach this view with a mouse you have two options,

Tiles: The operations visible here change depending on what is supported by the application
