

either click on the minus icon on the bottom-right of the screen, or using the scroller of your mouse in addition to the [Ctrl] key. Keyboard users can use [Ctrl]+[+] and [Ctrl]+[-] to zoom in and out respectively.

In this mode you will be able to highlight and entire group and drag and drop it into place. You can right click, swipe and select, or press spacebar to select a group, in which case you can again get a command bar. This should have only one option, “Name Group”, which does what you’d expect.

Once a column is filled, the next one starts

The Charms bar

There are a couple of ways to access the charms bar. For touchscreen users, you can swipe in from the right edge of the screen to show this bar. For mouse users, the process is a bit more complex; move the mouse to the top-right or bottom-right corner of the screen, the bar will begin to show up, then move the mouse along the edge (down or up depending on where you started) to access the bar. For keyboard users there is a shortcut for each feature of the charms bar. These are listed in the last chapter of this booklet. The main shortcut you need to know is [Win]+[C] (Win is the Windows or Start key on your keyboard).

The charms bar has a number of “charms”, which are essentially points of integration for Windows 8 applications. You will find five such charms on this bar.

The **search charm** at the top lets you search the current application, if it is the kind of application that has anything to search. For example, an eBook reader app might let you search for books in your collection. A photo editor app on the other hand might have nothing to search for, or it might just let you search for filters to apply to an image. If you open the search charm from the start screen or desktop, it will search installed application by default. However at any point you can use it to switch to searching files, settings, installed apps, or searching a particular installed app.
