

The **share charm** lets you share content from the app you are using. To use this the app you are using should have something to share, and support sharing. A web browser for example should let you share the current URL, a music library application might let you share the name of the currently playing app as your status. You also need an application to share with, for example, a twitter app, or a photo sharing app. Sharing isn't just about links, applications can share images, text or even arbitrary files. So if you share that zip file you might find yourself faced with a the Dropbox and SkyDrive apps while sharing a link will show you your Twitter and Facebook apps. An app participates both ways as well, so you can share files on your Dropbox via mail, but you can also share files from your Photo app with Dropbox. You cannot share from the desktop or desktop apps.

The **Start charm** in the middle takes you to the start screen. If tapped or clicked while on the start screen it goes back to the last used app.

The **Devices charm** allows sending content from an app to connected devices. This includes sending documents to a printer, streaming a video to your TV, or streaming audio to a home theatre system.

The **Settings charm** is a standardised way you can access the settings for any application. Nearly every application has some or the other configuration settings associated with it, and this is where you will find the settings for Windows 8 apps. In desktop mode it links to the desktop related settings such as the control panel and personalisation. At any point it will also show other system setting such as the network information, volume control, brightness control, notifications, power and keyboard settings. It also has a link to the Modern UI control panel.

As you can see, charms might take a while to get used to, but they standardise the way you can access some of the most common features found in most applications.

Multiple groups, with a little gap in between
