

Welcome to the new “modern” control panel

words, and PIN based login schemes in addition to a standard password.

Notifications: Windows 8 has an in built Notification system that can show updates from installed apps. Here you can configure which apps are allowed to show notifications, whether notifications should be shown on the lock screen and whether a sound should accompany a notification.

Search: Like the notifications page, the Search page lets you opt out from showing certain apps while searching – useful once things start getting busy. Here you can also clear your search history and configure if search should show suggestions.

Share: Settings related to sharing between apps are listed here. As with notifications and search, you can disable apps from showing up when you are sharing.

General: Here you can configure settings related to the time, switching apps, spelling (yes Windows 8 has in-built spelling correction), language, application storage, refresh and reset, and advanced start up.

While most of the other options are quite intuitive, advanced start-up could need some explanation. Since Windows 8 could potentially be used on a touch-screen only device, how do you access the boot menu which requires pressing F8? Advanced start-up is the answer. When you want to boot to another OS or run recovery options, you can restart the system from here rather than the regular way.

Privacy: Here you can let Store apps access your location, or use your real name and account picture. You can also participate in an improvement program for Windows Store that will send the URL for any content you browse using apps to Microsoft.

user accounts, or configure your own sign in options. If you connected your login account to a Microsoft account while creating it, you will have an option here to unlink it. You can also configure how you sign into your account. Windows 8 supports picture passwords, and PIN based login schemes in addition to a standard password.
