

viewing pictures and the Music app as the default for opening MP3 files. Both these apps are Modern UI apps and if you fancy using them, consider the fact that Modern UI apps don't create a button in the taskbar. Here's where the Snap Apps feature is your mate.

Taking the decision about when to use Modern UI apps and when to use Desktop apps when both are available on the same system can be difficult. To make it easier, take these parameters into account:

1. **On what device are you using Windows 8?** – With new devices constantly entering the market, the options have widened and the OS can run on almost all of them – be they PCs, tablets, laptops /ultrabooks or convertibles.
 - For a PC, laptop or ultrabook, we recommend a desktop app over a Modern UI app. Modern UI apps are built for touchscreens and the controls aren't very friendly for a mouse user. You can also expect a void of keyboard shortcuts for Modern UI apps.
 - A convertible device can transform from a tablet into an ultrabook and vice versa. Your usage of the device itself should determine the choice of apps. If you prefer the tablet mode, Modern UI apps are the way to go. If you use it more as an ultrabook (and mind you, we're skipping the touchscreen usage), desktop apps would please you.
2. **How frequently do you use a keyboard and mouse?** – If you change applications in a jiffy remembering the sequence in which [Alt + Tab] will bring them up on the screen and you add footnotes to MS Word documents using a keyboard shortcut, Modern UI apps would annoy you.
3. **Is it a convertible device?** – Touchscreens are awesome – they avoid keystrokes, use less energy, feel smooth and since the keypads don't take up any space, you get larger screens. Using touch on a desktop PC can be a pain, but on a laptop, it can feel very natural. Make sure you try out both before considering a purchase as this can drastically affect your views on Windows 8.
4. **How advanced a user are you?** – Advanced users know their way around the system. They change options frequently based on needs and squeeze as much juice as they can get out of every device and app. Typically an advanced PC user (touchscreen geeks excluded) uses a lot of keyboard shortcuts and Windows 8 supports plenty of those. An advanced user might find the extra mouse movements frustrating but can get used to them in time.
