

Three buttons in the 'Select' section allow you to select all files, select none or invert the selection (deselect the selected ones and select the unselected).

Share tab

Here you get the common options to share the files you've selected in the main window. You may zip the files, burn them to a disc and if Windows knows how to print the file, it would enable the print and fax buttons. For some strange reason, the Email button didn't get enabled even after having configured the Mail app (Modern UI app) successfully. Explorer doesn't seem to recognize the app as an email handling program and throws an error if we try to use right-click > Send to > Mail recipients. Sharing files with the homegroup and revoking the permissions are a click away.

While advanced users would have already used the functionality to their advantage in the past, Advanced Security button exposes those arcane, difficult-to-understand options to a normal user. We'll try to explain some of its functions in the chapter dedicated to security.

View tab

There are times when one can live with less screen real estate while there are other times when one needs all the space they can get with all folders shown, especially when looking for a file buried deep inside folders. Until Windows 7, the options were located in the 'Folder Options' dialog box only. The View tab exposes the most useful functions from that dialog box.

The navigation pane can be enabled/disabled in just a couple of clicks and customizing its view is quite easy as well. You can toggle one of the preview or details panes on the right side of the window without any difficulty (the details pane no longer appears at the bottom of the window). View layout options is now visible easily as opposed to the old 'click to open a menu with a vertical slider' style. The good part is: the layout will change temporarily as and when you hover over the option (in much the same way it happens when you hover over the 'styles' in MS Word 2007 and higher). The bad part is: if you scrolled all the way down in the directory, an accidental hover on the layout styles will send you back to the top again.

The 'Current view' section allows you to sort and group the view the way you'd like covering the options we'd usually find in the View, Sort by and Group by entries of a right-click menu (call it the 'context menu' if you will). Seeing hidden files and hiding the currently visible ones are both single clicks away – the process is so simple now that it almost defeats the
