

overhaul. There are new tabs added to the interface and the information shown is better organized.

With time, all apps have become update hungry. Almost every application you can install has the capability to update itself over the Internet. Some applications do it silently without informing you and they don't even show you an option to alter this behavior. Google Chrome serves well as one such example. The Processes tab has replaced the Applications tab and hosts

The Task Manager has become more meaningful than ever in Windows 8

an extra column to show the network bandwidth consumption by processes. This is truly useful for those who want to save every bit of network resource. If your network is not working at the speed you're expecting it to, open Task Manager in Windows 8 and if you find a resource consuming process, kill the culprit. At the top, you have the total resource usage for each category (CPU, Memory, Disk and Network). Processes using

more resources than others are easily distinguishable by the intensity of the background color. You can view the list of application windows running under one process by clicking the triangle on the left of the process name entry. Windows processes show up along with other background processes as well. The background processes list would typically also contain the tray icon processes among others – making it easy to kill off a process if it doesn't offer an 'exit' option! However, the Processes tab doesn't show the Modern apps by default. To view them, you need to enable them from the menu; follow the path View > Status Values > Show suspended status.

The performance tab has a summary view which does away with details and makes the window look like a widget showing you the summary of resource usage. The regular view has been split into two – resource names on the left, graphs on the right. Clicking the resource name on the left shows the detailed view with the resource graph on the right. Each resource has its graph summary view as well. We have a screenshot with CPU graph over-
