

It is possible to pin the desktop version of IE to the start menu

Explorer – one for the desktop, another for the mobile view (Modern UI). Both versions share the basics – favorites, frequent sites, history etc. RSS Feeds however remains an exclusive feature for the desktop version of IE. Favorites and frequent sites are shown on the IE for Modern UI app when you focus

on the address bar at the bottom. History can't be seen in the Modern UI app although the visits are recorded to form a part of history you can view in the desktop version.

The tile present by default on the start screen will lead you to the Modern UI version of IE. To open the desktop version you need to go to the desktop and start it from the taskbar. If you wish to pin the desktop version of IE to the start screen, follow the steps:

1. Create a shortcut on the desktop (right-click Menu > New > Shortcut) and put the location as: %PROGRAMFILES%\Internet Explorer\iexplore.exe in the new shortcut wizard.
2. Name the shortcut as 'Desktop IE' or anything else you want.
3. Right-click the shortcut on the desktop and select 'Pin to start' option.

That's all. Go back to the start screen and you should have an entry on the far right (named as 'Desktop IE' in this case) added to the list. Drag it to your favorite position and you're done!

PC Settings and Control Panel

You're probably going to hate this but Microsoft has split the control panel into two as well. While this move has its own advantages for the end user, it does complicate things for the power user. A simple observation is enough to understand that the basic settings from each section have been moved to the PC settings interface. For example, advanced user management options such as Family Safety, configurations for user type, network adapter, windows firewall etc. remain in the desktop interface whereas simpler options such as changing passwords, creating new users, connecting to a Wi-Fi hotspot etc. are now a part of the PC Settings app. To clear your confusion, in any case, and know whether a setting has been migrated to the PC Settings app, all you need to do is answer a simple question – does the setting make sense for a tablet? If the answer is yes, the setting would probably be located in the PC Settings app. If no, the control panel is where one should search for it.
