

2. Web filtering:

This can prevent access to certain websites, using an automated ratings system (has to be previously selected) or restrict access to selected websites. This can help ensure that children are not wasting time in the name of doing research on Wikipedia.

Family Safety can be used to restrict the period during the day when the child account can be assessed on the PC.

3. **Game and Store settings:** This enables the parent to set an age-based or content-based rating level for the games your child can view, download and install from the Windows Store.
4. **App restriction:** The child won't be allowed to launch certain apps. It would help the parent emphasize that the child can launch a music player but not a game.

Windows Defender

Introduced during the days of Vista's rise and immediate fall, Windows Defender has now matured into a full-fledged antivirus. You can launch Defender using the start screen search. Just like any other antivirus, it would update itself over the internet periodically and will scan the computer or a folder when you want. Like a faithful protector, it sits in the background, aware and ready to defend you if it senses suspicion. Windows Defender is installed and enabled by default and is set to download updates automatically by default as well.

Windows Firewall

If securing your PC from unwanted physical access is the first step towards security, having a good firewall would definitely be the second. A firewall's responsibility is to block the incoming and outgoing traffic over the network. Windows, since XP Service Pack 2 has provided a firewall which can get the job done. While it shows you a simple interface in Control Panel, a much advanced core sits beneath.
