

Automatically Log into Windows

If you only have a single user on your computer, there is little reason to be stuck at a login screen when you start your computer. If you agree with us, you might want to set up your computer to automatically log in on startup.

Here is how you can do that:

- ▶ With the Windows start screen open type “netplwiz” and press enter to launch the User Accounts manager
- ▶ Deselect the checkbox next to “Users must enter a username and password to use this computer.”
- ▶ Click OK on the dialog to save changes.
- ▶ This will prompt you to enter the default login credentials; enter them and press OK.
- ▶ Reboot

Your computer should now automatically log in as this user.

Tiles for rebooting or shutting down your PC

Windows 8 doesn't exactly place the shutdown and reboot options in a convenient place. The options are accessible though a multi step process of opening the charms bar – which could take a few steps of its own – clicking on Settings, then clicking on power, and finally clicking on Shutdown, Reboot, Hibernate or Sleep. Or you can press Ctrl+Alt+Del and choose the power options from there.

If you want to simplify the way you shut down or restart your computer, one way is to simply create shortcuts for those tasks on your start screen.

Windows includes a command line utility “shutdown.exe” that allows you to perform shutdown, reboot, sleep or hibernate actions using a simple command. You can simply create a shortcut to the shutdown.exe with the correct parameters, and clicking on that shortcut will then perform that action. After creating the shortcut, right click on it, and select Pin to Start.

Depending on what action you want to perform, here is what the shortcuts should point to:

It may be a security compromise but your computer is up and running faster
